

Assignment 10: End-to-End Lead Capture and Qualification Workflow

SUBMISSION GUIDELINES

- Create one folder.
- Put all required files inside.
- Upload the folder on Google Drive.
- Upload the Drive Link on the submission portal by giving permission to View to All.

Folder Must Contain

- Workflow JSON copied in a Google Doc
- Screenshots of the workflow canvas and execution results
- Brief explanation of how your workflow works and the logic behind each node

Do NOT upload separate files.

Do NOT submit a private Drive link.

Objective: Create an end-to-end workflow that captures leads from a form submission, qualifies them based on defined criteria, stores them in a database, and sends appropriate notifications.

What You Need To Do

Create a new n8n workflow and add a Webhook node to capture lead submissions with fields: name, email, phone, company, budget, and source.

Clean and validate the incoming data (e.g., check for valid email format, non-empty required fields).

Use IF/Switch nodes to classify each lead into one of three tiers:

1. Hot Lead: High budget + corporate email domain.
2. Warm Lead: Medium budget or personal email with good data completeness.
3. Cold Lead: Low budget, missing fields, or free email domain.

Store all leads in a Google Sheet with their qualification status and a timestamp.

For Hot leads, send an immediate Email + Slack notification to the sales team. For Warm leads, add them to a follow-up queue (e.g., a separate Google Sheet tab).

For Cold leads, store them in an archive sheet for future reference.

Requirements:

4. Capture leads via Webhook with at least 5 data fields.
5. Validate and clean the incoming data before processing.
6. Implement a multi-tier qualification system (Hot, Warm, Cold).
7. Store all leads in Google Sheets with qualification status.
8. Send targeted notifications based on lead quality.
9. Handle edge cases: duplicate leads, missing data, invalid formats.
10. The workflow should be modular and easy to extend.

Enhance your workflow by:

11. Adding AI-based lead scoring using an OpenAI node to analyze lead intent.
12. Implementing deduplication logic to prevent storing the same lead twice.
13. Creating a daily lead summary report with counts per category.
14. Adding an enrichment step to fetch company details from an external API.

Note: Make sure to test your workflow thoroughly and include screenshots or logs demonstrating the successful execution of your automation.
